COMPRESSION CHECK

HINT: If there is lack of power, excessive oil consumption or poor fuel mileage, measure the cylinder compression pressure.

- 1. WARM UP ENGINE
- 2. REMOVE SPARK PLUGS
- 3. DISCONNECT DISTRIBUTOR CONNECTOR
- 4. DISCONNECT COLD START INJECTOR CONNECTOR

5. MEASURE CYLINDER COMPRESSION PRESSURE

- (a) Insert a compression gauge into the spark plug hole.
- (b) Fully open the throttle.
- (c) While cranking the engine with the starter motor, measure the compression pressure.

NOTICE: This test must be done for as short a time as possible to avoid overheating of the catalytic converter.

HINT: A fully charged battery must be used to obtain at least 250 rpm.

- (d) Repeat steps
- (a) through (c) for each cylinder.

Compression pressure:

1,177 kPa (12.0 kgf/cm2, 171 psi)

Minimum pressure:

981 kPa (10.0 kgf/em2, 142 psi)

Difference between each cylinder:

98 kPa (1.0 kgf/cm2, 14 psi) or less

- (e) If cylinder compression in one or more cylinders is low, pour a small amount of engine oil into the cylinder through the spark plug hole and repeat steps (a) through (c) for the low compression cylinder.
- If adding oil helps the compression, chances are that the piston rings and /or cylinder bore are worn or damaged.
- If pressure stays low, a valve may be sticking or seating improperly, or there may be leakage past the gasket.
- 6. CONNECT COLD START INJECTOR CONNECTOR
- 7. CONNECT DISTRIBUTOR CONNECTOR
- 8. INSTALL SPARK PLUGS

Torque: 18 N-m (180 kgf-cm, 13 ft-lbf)
